Metropolitan Area Planning Council

National HIA Meeting  
September 2013  
Washington, DC

# A Healthy **T** for a Healthy Region

PROJECTED 2012 MBTA DEFICIT: **\$161 MILLION**  
 YEARLY HEALTH COST: **\$272.1 MILLION / \$386.9 MILLION**

  COST OF  
ADDITIONAL  
TIME IN TRAFFIC  
**\$137.5 MILLION**  
**\$186.0 MILLION**

 COST OF  
ADDITIONAL  
MORTALITY,  
AND HOSPITALIZATIONS  
DUE TO AIR  
POLLUTION\*  
**\$1.5 MILLION**  
**\$2.1 MILLION**

 COST OF  
ADDITIONAL  
FUEL BURNED  
**\$22.7 MILLION**  
**\$31.8 MILLION**

## PROPOSED FARE INCREASE AND SERVICE REDUCTIONS SCENARIOS:

**SCENARIO ONE**  
FARES WOULD  
INCREASE BY **43%**  
AND SERVICE  
REDUCTIONS  
WOULD AFFECT  
BETWEEN **38-48**  
**MILLION**  
TRIPS PER YEAR

**SCENARIO TWO**  
FARES WOULD  
INCREASE BY **35%**  
AND SERVICE  
REDUCTIONS  
WOULD AFFECT  
BETWEEN **53-64**  
**MILLION**  
TRIPS PER YEAR

 COST OF LIVES  
LOST DUE TO  
DECREASED  
PHYSICAL ACTIVITY  
**\$74.9 MILLION**  
**\$116.5 MILLION**

 COST OF  
ADDITIONAL  
CAR CRASHES,  
INCLUDING  
CRASHES WITH  
BICYCLES AND  
PEDESTRIANS  
**\$33.6 MILLION**  
**\$48.8 MILLION**

 COST OF  
CARBON EMISSIONS  
**\$1.9 MILLION**  
**\$1.7 MILLION**

\*FOR ASTHMA, CHRONIC LUNG DISEASE, HEART ATTACKS, HEART DISEASE, AND MAJOR CARDIOVASCULAR EVENTS

## A Health Impact Assessment of Proposed MBTA Service Cuts and Fare Increases

Frame issue:  
 Explain MBTA deficit of \$161 million  
 Obligated to fill this deficit

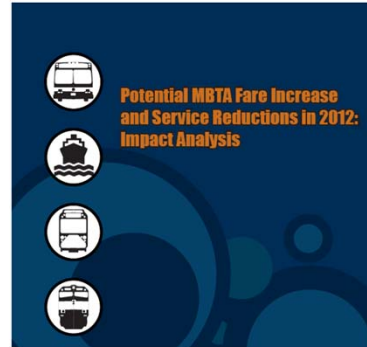

## The T is a Health Resource

- Free Time ↑
- Physical Activity ↑
- Access to Health Care ↑
- Disposable Income ↑
- Air Pollution ↓
- Accidents ↓
- Noise ↓

## Methodology

- The Central Transportation Planning Staff (CTPS), which is the transportation planning staff for the Boston Region Metropolitan Planning Organization, had projected changes to ridership, automobile travel, and vehicle emissions
- MAPC applied findings from peer reviewed scientific literature to the CTPS transportation model results
- Consulted local experts on air quality, environmental health, and physical activity

Boston University School of Public Health

## Time Spent in Traffic: 30,000 – 48,000 new drivers will slow traffic for everyone

	SCENARIO 1	SCENARIO 2
People who Shift from Transit to Driving per Year	30,400	48,600
Additional Time Driving per Year	18,500 hours (770 days)	25,100 hours (1,045 days)
Annual Cost of Wasted Time	\$137.5 million	\$186.0 million

More time in traffic creates stress and leaves less time for healthy activities, such as exercising or cooking.

In order to estimate the number of individuals switching from transit to driving: difference between the number of daily transit trips that currently take place and those that would occur under Scenarios 1 and 2

We assumed, in consultation with CTPS, that each weekday transit rider completes two MBTA trips per day (i.e., to and from work) and that 95% of individuals shifting from transit would instead drive under the proposed scenarios

More time in traffic creates stress and leaves less time for healthy activities, such as exercising or cooking

From CTPS estimates, average travel speeds will drop from 32.7 miles per hour (mph) to 32.5 mph under Scenario 1 and to 32.4 mph under Scenario 2

To estimate how much time the region's drivers would spend in traffic due to driving at slower average speeds, we divided the current regional VMT by the speeds under the different scenarios

We multiplied this number of extra person-hours in cars by \$16.94, or the value of one hour of travel time in the greater Boston region in 2012 dollars

We valued time spent driving in trucks at \$91.60/hour per vehicle in 2012 dollars, assuming trucks are used for commercial purposes

It is important to note that we calculated these losses based on current vehicle-miles traveled (VMT), ignoring the impact of slower speeds on new drivers

## Fuel Burned: New drivers take on new fuel costs; Congestion costs everyone

	SCENARIO 1	SCENARIO 2
Additional Annual Fuel Costs	\$22.7 million	\$31.8 million

Additional gas costs leave less disposable income for healthy foods, prescriptions, other health-related purchases.

Additional gas costs leave less disposable income for healthy foods, prescriptions, other health-related purchases

Fuel use under each scenario was calculated by using the Texas Transportation Institute

Report's equations to calculate average fuel economy in gallons per mile for trucks and automobiles separately

From CTPS estimates, we calculated the miles driven under each scenario by multiplying the VMT for automobiles and trucks

Miles driven for automobiles and trucks were then multiplied by the cost of fuel for each vehicle type and using the TTI estimates for Massachusetts 2010 average gasoline cost of \$2.86 / gallon and an average diesel cost of \$3.16 / gallon (2012 dollars)

## Air Pollution: More cars mean less healthy air

	SCENARIO 1	SCENARIO 2
Deaths Caused by Worse Air Quality per Year	0.18	0.26
Hospitalizations Caused by Worse Air Quality per Year	0.17	0.24
Annual Cost of Exposure to Additional Air Pollution	\$1.5 million	\$2.1 million

More car exhaust produces air pollution, leading to increases in asthma, chronic lung disease, heart attacks, heart disease, and major cardiovascular events. “Near roadway” pollution will have additional impacts not quantified here.

More car exhaust produces air pollution, leading to increases in asthma, chronic lung disease, heart attacks, heart disease, and major cardiovascular events. “Near roadway” pollution will have additional impacts not quantified here. CTPS modeled emissions using EPA’s MOBILE 6.2 software, which takes VMT and travel speeds to estimate air pollution emissions

Models gave emissions estimates for Particulate Matter smaller than 2.5 microns in aerodynamic diameter (PM<sub>2.5</sub>) and NO<sub>x</sub>

We then used an EPA Source-Receptor Matrix to convert emissions data into concentrations of air pollution at the county level

Population counts by county were taken from the US Census

Hospitalization rates for asthma, cardiovascular disease, myocardial infarction, COPD, and ischemic heart disease were taken from Massachusetts Community Health Information Profile (MassCHIP) while mortality rates came from the CDC Wonder Database

Concentration-Response Function for PM<sub>2.5</sub> and NO<sub>x</sub> were taken from EPA’s Environmental Benefits Mapping and Analysis Program (BenMAP)

The value of statistical life (VSL) of \$8.32 million in 2012 USD was used to monetize mortality endpoints

BenMAP includes costs for hospitalizations, which includes: the cost of illness to society, which includes the total medical costs plus the value of the lost productivity; the willingness to pay of the individual, as well as that of others, to avoid the pain and suffering resulting from the illness

Did not include the effects of exposure to other pollutants, including SO<sub>2</sub>, CO, ozone, and ultrafine particles

EPA’s MOBILE6.2 model does not incorporate additional emissions that would occur due to stop and go traffic

Did not calculate effects of air pollution on stroke, premature birth, infant mortality, and childhood asthma

Greater negative impact on lower income and minority communities, further exacerbating the disproportionate health burden that these communities face

Estimates also do not include increased exposures for commuters, who will be spending more time in traffic in close proximity to elevated concentrations

## Physical Activity: Taking the T gets you up and walking

	SCENARIO 1	SCENARIO 2
Lost Physical Activity	250,000 minutes per day	403,000 minutes per day
Lost Caloric Expenditure	8.2 million per day	13.1 million per day
Additional Cases of Obesity Caused by Sedentary Behavior per Year	70	120
Additional Deaths Caused by Sedentary Behavior per Year	9	14
Annual Cost of Lost Physical Activity	\$75 million	\$116 million

Regular physical activity not only prevents obesity, it helps control blood pressure and blood sugar, increases strength and flexibility, and is good for mental health.

Regular physical activity not only prevents obesity, it helps control blood pressure and blood sugar, increases strength and flexibility, and is good for mental health.

Use estimate of how many people would switch from transit to driving from CTPS data US DOT and FHWA National Household Travel Survey data indicates that transit users partake in 8.3 additional minutes of daily walking per day

Introducing this amount of daily walking can prevent 0.25% of that population from becoming obese despite upward national trends in obesity prevalence

Health Economic Assessment Tool (HEAT) from the World Health Organization (WHO)

Developed by WHO with the guidance of an advisory group of international experts in health, epidemiology, health economics, transport economics, practice/advocacy, and policy development and implementation

Based on systematic reviews of the epidemiologic literature, this tool allows us to estimate changes in mortality based on population-level changes in physical activity

We used our CTPS-based estimate on those that would shift to driving and simulated an intervention using the HEAT Tool where 30,000-48,000 people would walk 8 minutes less 5 days a week

## Total Cost: We Lose More than We Save

Annual Impact	Scenario 1 Cost	Scenario 2 Cost
Cost of additional time in traffic	\$137.5 million	\$186.0 million
Cost of additional fuel burned	\$22.7 million	\$31.8 million
Cost of additional car crashes, including crashes with bicycles and pedestrians	\$33.6 million	\$48.8 million
Cost of additional mortality and hospitalizations for asthma, chronic lung disease, heart attacks, heart disease, and major cardiovascular events due to air pollution	\$1.5 million	\$2.1 million
Cost of lives lost due to decreased physical activity	\$74.9 million	\$116.5 million
Cost of carbon emissions	\$1.9 million	\$1.7 million
<b>Total annual cost</b>	<b>\$272.1 million</b>	<b>\$386.9 million</b>

**To balance a \$161 million budget:  
Costs exceed savings generated by service cuts and fare hikes**

# Outcomes

The screenshot shows a Metro magazine article from The Boston Globe. The article title is "Study: T belt-tightening would hurt health" by David Abel and Eric Moskowitz, dated March 13, 2012. Below the title are two sub-headlines: "How MBTA Cuts, Fare Hikes Could Impact Health" and "Report: Proposed MBTA Changes Would Hurt Health". A video player for WGBH News Focus "The MBTA" is visible, with the subtitle "Fare Hikes and Your Health". To the right of the article is a bulleted list of outcomes.

- Report released on March 13, 2012
- Presented to MBTA officials at the Massachusetts State House
- Over 25 unique press hits, MAPC's Executive Director interviewed for the local news, MAPC Staff interviewed on local radio
- Report was cited at final MBTA hearings on fare hikes
- On April 4, 2012, the MBTA board approved plans to hold average fare increases at 23% and to institute modest service cuts
  - Down from proposed 35% to 43% increases and deep service cuts
