Beyond the numbers

Tennessee’s overall EPI average improved by about 4 percentage points from 2008 to 2012, just below the average change across all states. The improvement was driven primarily by the addition of a postelection audit requirement, better data completeness, and a drop in the mail ballot rejection rate, which was the second-lowest in the country, behind neighboring Georgia.

But low turnout, along with offering just two of five voting information lookup tools, prevented Tennessee from breaking into the top half of performers.
Room for improvement

Tennessee can improve its election performance in several ways. For instance, the state could make all five voting information lookup tools available on its elections website for the 2014 election. This would improve voters’ experience by providing them with the information they need about an election where they are most likely to look for it—online.

Tennessee could further improve its overall performance by adding online voter registration. Not only would this raise the state’s score for the online registration indicator, but it could also have a positive impact on other metrics, including the voter registration rate, wait time, nonvoting due to registration and absentee ballot problems, and provisional ballots cast.

The Presidential Commission on Election Administration also recommended online voter registration.
