To provide context for each state’s spending on health care services, the State Health Care Spending Project examined 20 health indicators that show wide variation among states’ residents. Given the complexity of achieving and maintaining good health, direct correlations cannot and should not be made between the health status of the population of a state and the level of its health care spending. High-value health care is as much about how dollars are spent as it is about how many dollars are spent. Find the full analysis, Tracking Key Health Indicators: Providing context for state health care spending, at www.pewtrusts.org/healthcarespending.

The State Health Care Spending Project, a collaboration between The Pew Charitable Trusts and the John D. and Catherine T. MacArthur Foundation, is examining seven major areas of state health care spending—Medicaid, the Children’s Health Insurance Program, substance abuse services, mental health care, prison health care, active state government employee health insurance, and retired state government employee health insurance. The project is providing a comprehensive examination of each of these health programs that states fund. The programs vary by state in many ways, so the research highlights those variations and some of the principal factors driving them. The project has also released state-by-state data on 20 key health indicators to complement the programmatic spending analysis.
